

# Ablació de la fibril·lació auricular. Ha arribat l' hora de la generalització?

Arguments a favor

Dr. Julio Martí Almor

Secció arítmies Hospital del Mar

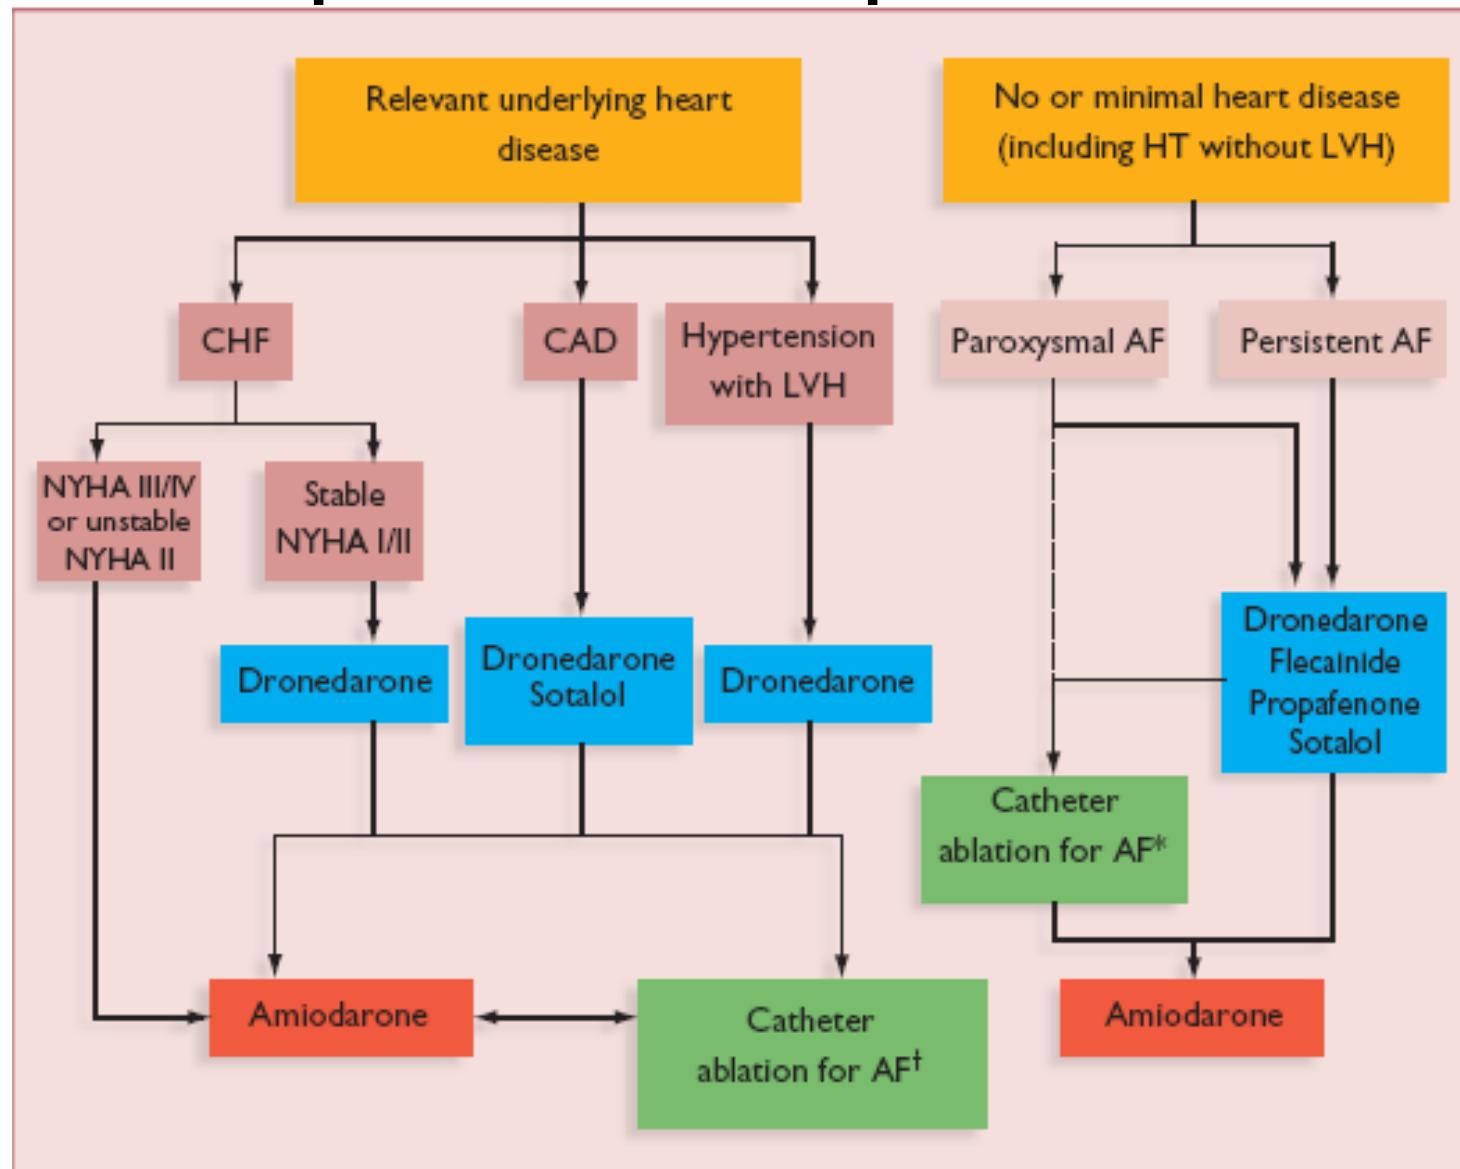

# De que estem parlant?

- Val la pena fer ablació a tots els malalts amb FA?----- NO
  - Malalts amb FA permanent o long standing especialment asimptomàtics i amb bon control de FC
- Ara be: ¿hi ha un grup creixent de malalts que es poden beneficiar de la ablació de FA?----SI

# Quins pacients es poden beneficiar de la ablació de FA?

- FA paroxismal
- FA persistent de menys de 6 mesos de duració
- Tot això avui dia amb malalt **simptomàtic**

# Perque amb FA paroxistica?

# En que es basa la recomanació?

- En estudis randomitzats. Quin son?
- En que la alternativa es pèssima: FAA
- Finalment en que les complicacions de la tècnica i els resultats a curt i llarg termini comencen a ser millors, i òbviament superen de lluny als FAA.

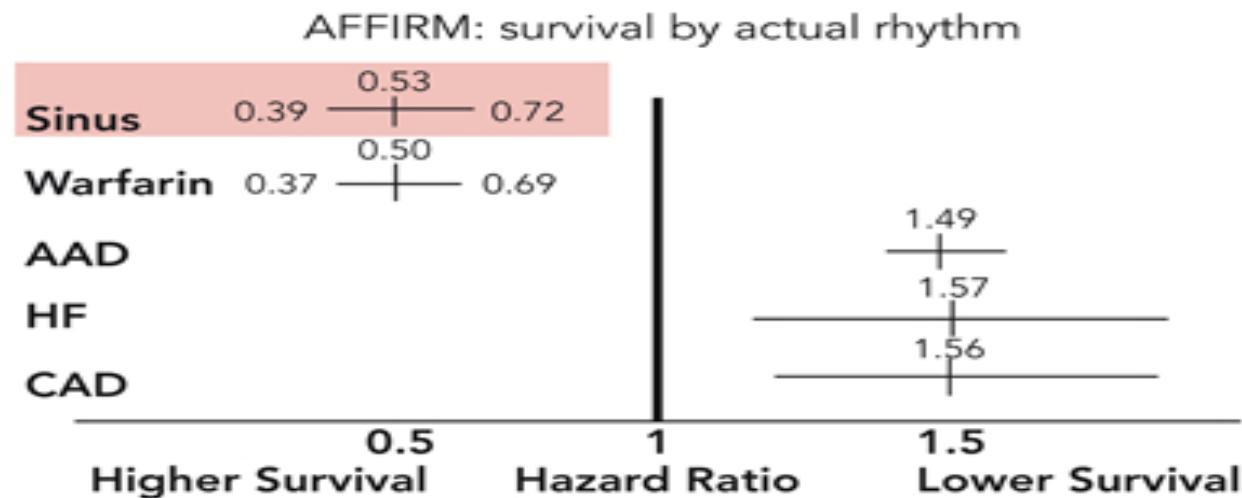

Estudio (año publicación)	Pacientes (n)	Edad media (años)	Tiempo medio de seguimiento (años)	Criterios de inclusión	Objetivo primario	Pacientes que alcanzaron el Objetivo primario		
						Control FC	Control Ritmo	p
PIAF (2000)	252	61,0	1,0	FA persistente (7-360 días)	mejora sintomática	70/127 60,80%	76/125 55,10%	0,32
AFFIRM (2002)	4060	69,7	3,5	FA paroxística o FA persistente, edad ≥65 a, o riesgo de ictus o muerte	Mortalidad de cualquier causa	310/2027 (25,9%)	356/2033 (26,7%)	0,08
RACE (2002)	522	68,0	2,3	FA persistente o flúter de menos de 1 año y 1-2 cardiovesiones en los últimos 2 años y anticoagulación oral	Compuesto: muerte cardiovascular, IC, hemorragia severa, implantación de MP, efectos tromboembólicos y efectos adversos severos de los FAA	44/256 (17,2%)	60/266 (22,6%)	0,11
STAF (2003)	200	66,0	1,6	FA persistente (>4 semanas y < 2 años. Tamaño de la AI> 45mm, IC CF II-IV de la NYHA, FEVI < 45%)	Compuesto: mortalidad total, complicaciones cerebrovasculares, reanimación cardiaca, eventos emboligenos	10/100 (10,0%)	9/100 (9,0%)	0,99
HOT CAFE (2004)	205	60,8	1,7	Primera FA persistente detectada (≥7dias, <2 años), edad 50-75 años	Compuesto: muerte, evento tromboembólico, hemorragia mayor/intracraneal	1/101 (1,0%)	4/104 (3,9%)	>0,71
AF-CHF (2008)	1376	66,0	3,1	FEVI≤35%, signos de IC, antecedentes de FA( ≥ 6h o CVE en los últimos 6 meses	Muerte cardiovascular	175/1376 (25%)	182/1376 (27%)	0,59
J-RHYTHM (2009)	823	64,7	1,6	FA paroxística	Compuesto: mortalidad total, ictus isquémico sintomático, embolia sistémica, hemorragia mayor, hospitalización por IC/ afectación psicológica.	89/405 (22,0%)	64/418 (15,3%)	0,012

# Es útil mantener el RS?

## Relationships Between Sinus Rhythm, Treatment, and Survival in the Atrial Fibrillation Follow-Up Investigation of Rhythm Management (AFFIRM) Study

The AFFIRM Investigators\*

Circulation. 2004;109:1509-1513.

In this analysis, the presence of SR was associated with a considerable reduction in the risk of death. These findings are consistent with those of the DIAMOND Study, in which the presence of SR throughout that trial was associated with improved survival.

The association of SR but not AADs with improved survival may reflect the fact that currently available AADs are neither highly efficacious nor completely safe.

# Quins són els estudis randomitzats?

Tabla 1. Estudios controlados comparando ablación por catéter y fármacos antiarrítmicos (FAA)

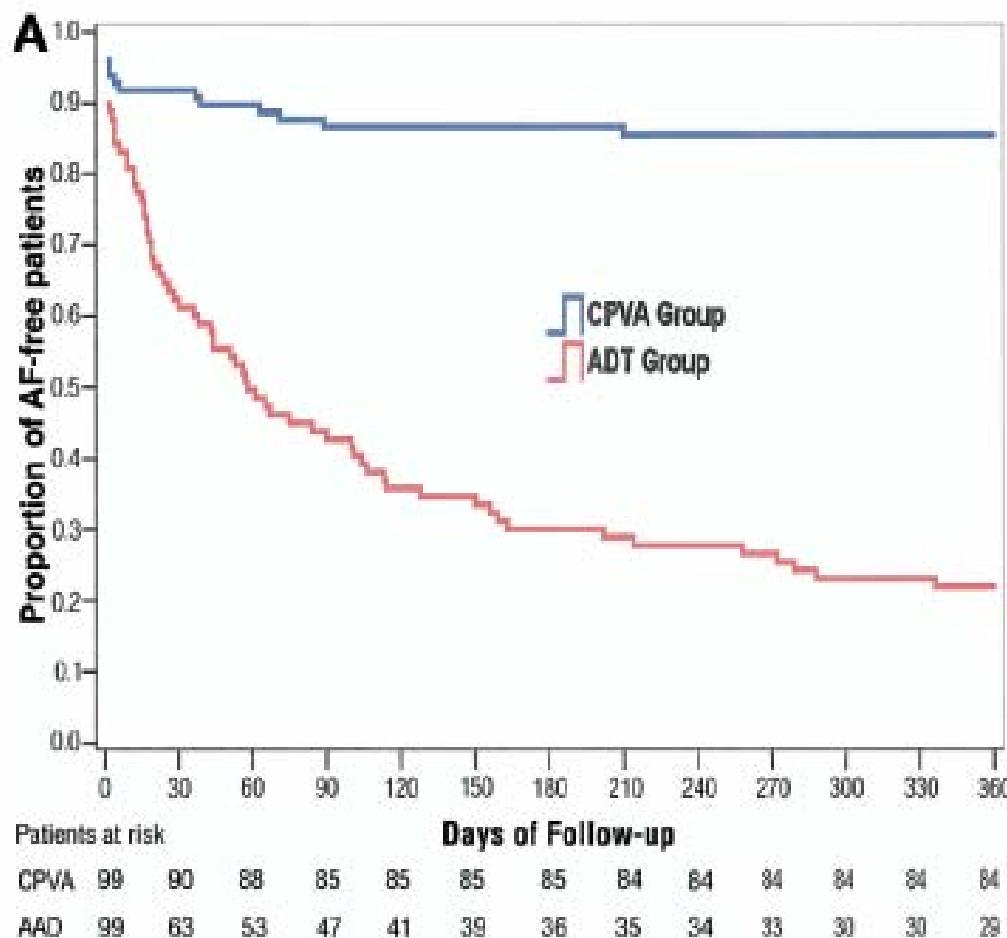

Estudio	Tipo de FA	Técnica de ablación	Libres de FA a 1 año		Año
			Ablación	FAA	
Wazni et al. RAAFT (6)	96% FAP 4% FA per	AVP	87%	37%	2005
Papone et al APAF (3)	100% FAP	ACVP + ICT	86%	22%	2006
Stabile et al CACAF (5)	67% FAP 33% FA per	ACVP + líneas en AI ± ICT	66%	9%	2005
Jais et al A4 study (2)	100% FAP	AVP ± líneas en AI ± ICT	89%	23%	2008
Forleo et al (h)	41% FAP 59% FA per	AVP ± líneas en AI ± ICT	80%	43%	2008
Wilber et al. Thermocool (4)	100% FAP	AVP ± líneas en AI ± ICT ± EFC ± líneas en AD	66%	16%	2010
Kritayaphong et al (11)	100% FA per	AVP + líneas en AD	79%	40%	2003
Oral et al (10)	100% FA per	ACVP + linea mitral y techo	74%	58%	2006

FAA: fármacos antiarrítmicos. FAP: FA paroxística. FA per: FA persistente.

AVP: aislamiento de VP. ACVP: ablación circumferencial de VP. ICT: istmo cavotricuspídeo. AI: aurícula izquierda. EFC: electrogramas fraccionados complejos; AD: aurícula derecha

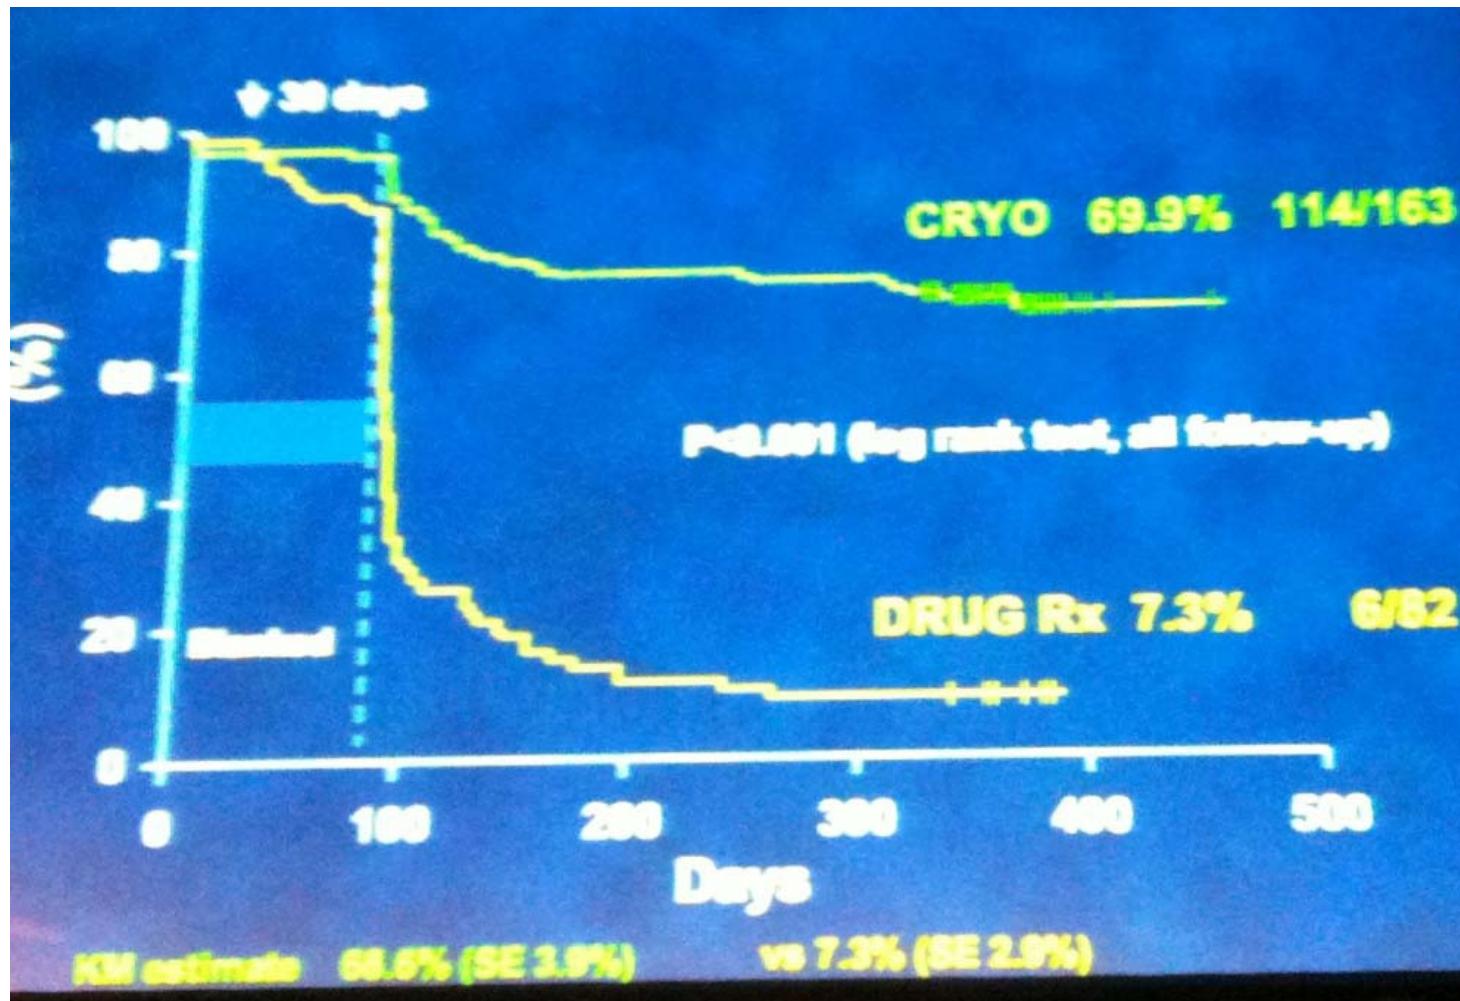

# A Randomized Trial of Circumferential Pulmonary Vein Ablation Versus Antiarrhythmic Drug Therapy in Paroxysmal Atrial Fibrillation

The APAF Study

# No depen del tipus de energia!!

## STOP-AF

# Que diuen els metaanalsis?

- Piccini et al Circ Arrhythm 2009: en 763 pacients demostra una proporció al any de RS amb AR del 79% vs 32 % amb FAA.
- Calkins at al en Circ Arrhythm 2009: AR superior a FAA especialment després de varius procediments i menor numero de complicacions.

# Treatment of Atrial Fibrillation With Antiarrhythmic Drugs or Radiofrequency Ablation: Two Systematic Literature Reviews and Meta-Analyses

Hugh Calkins, Matthew R. Reynolds, Peter Spector, Manu Sondhi, Yingxin Xu, Amber Martin, Catherine J. Williams and Isabella Sledge

*Circ Arrhythmia Electrophysiol* 2009;2;349-361; originally published online Jun 2, 2009;

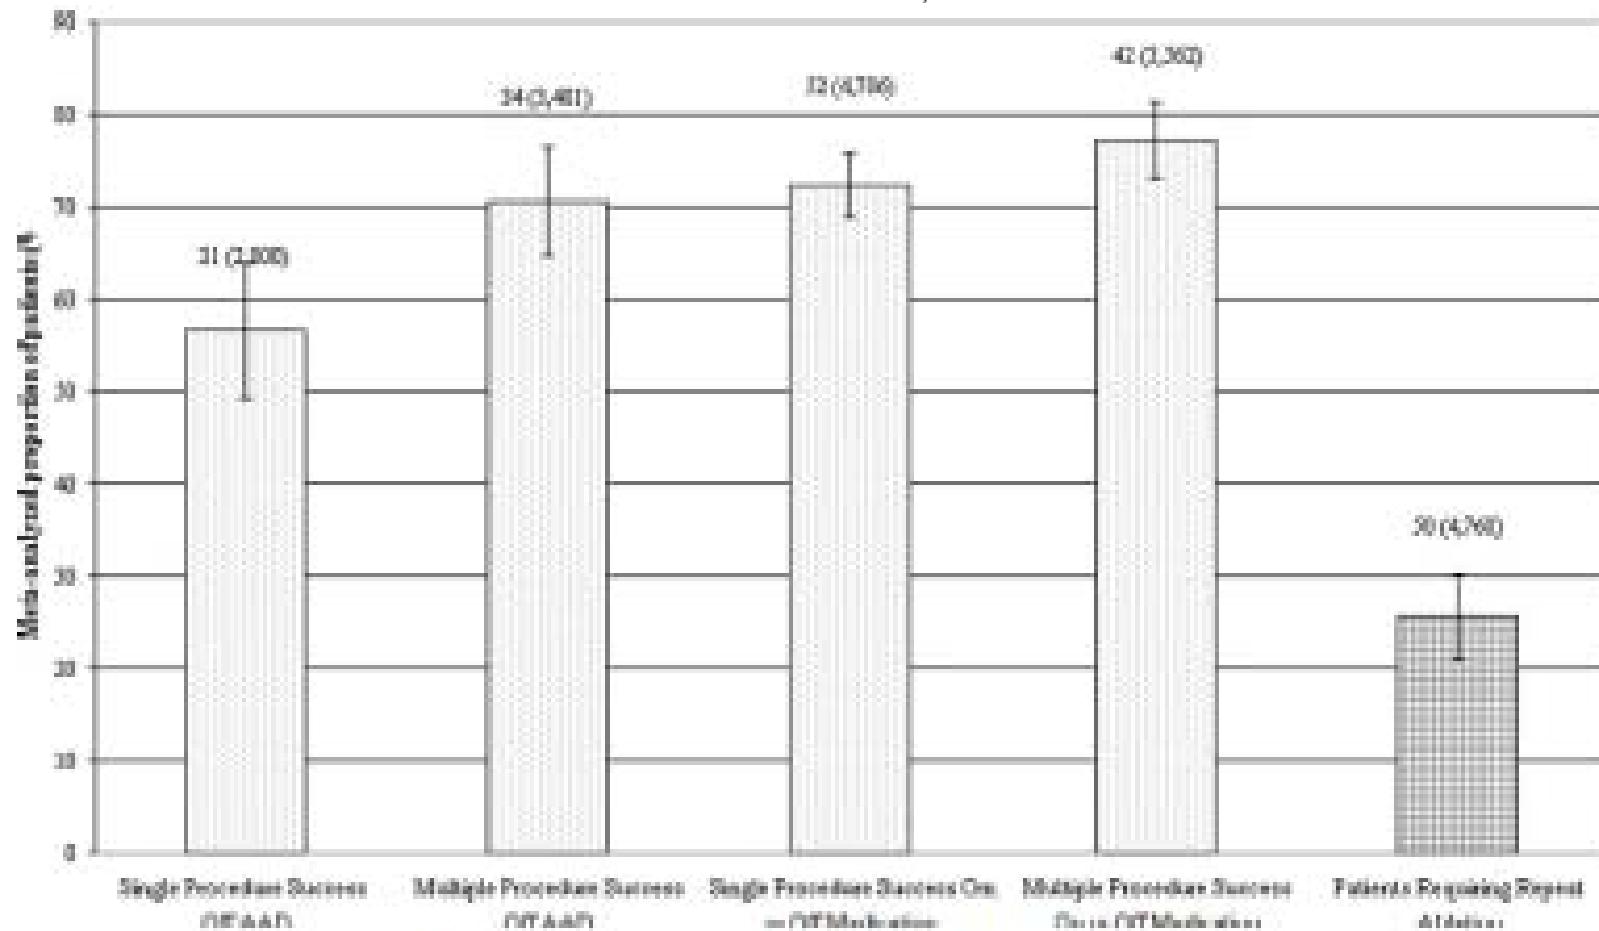

Figure 3. Efficacy of catheter ablation in patients with AF.

## MANTRA-PAF: A Randomized Multicenter Comparison of Radiofrequency Ablation and Antiarrhythmic Drug Therapy as First-Line Treatment in 294 Patients with Paroxysmal Atrial Fibrillation

**Background:** Medical treatment of atrial fibrillation (AF) is characterized by potential side effects and is often only moderately effective.

**Purpose:** To compare medical antiarrhythmic drug therapy (AAD) to radiofrequency ablation (RFA) as first-line treatment in paroxysmal AF.

**Design:** Randomized, prospective, phase 3 Scandinavian/German multicentre study. 294 patients; 7-day Holter monitor results; 2-year follow-up.

**Primary End Point:** Cumulative AF burden (% of AF) over 35 days and then in follow-up.

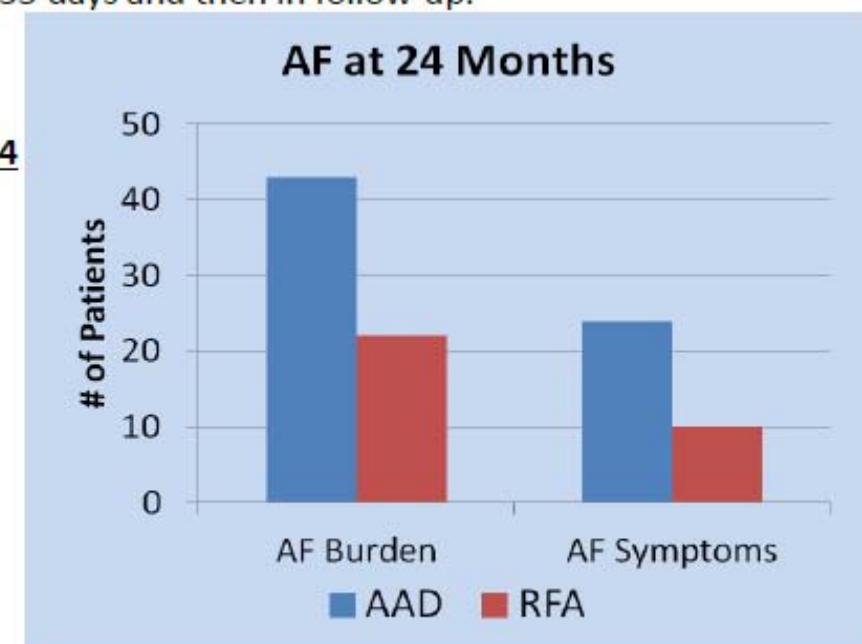

**Results:** At 24 months:

AF burden lower – 22/146 (RFA) vs. 43/148 (AAD), **p=0.004**

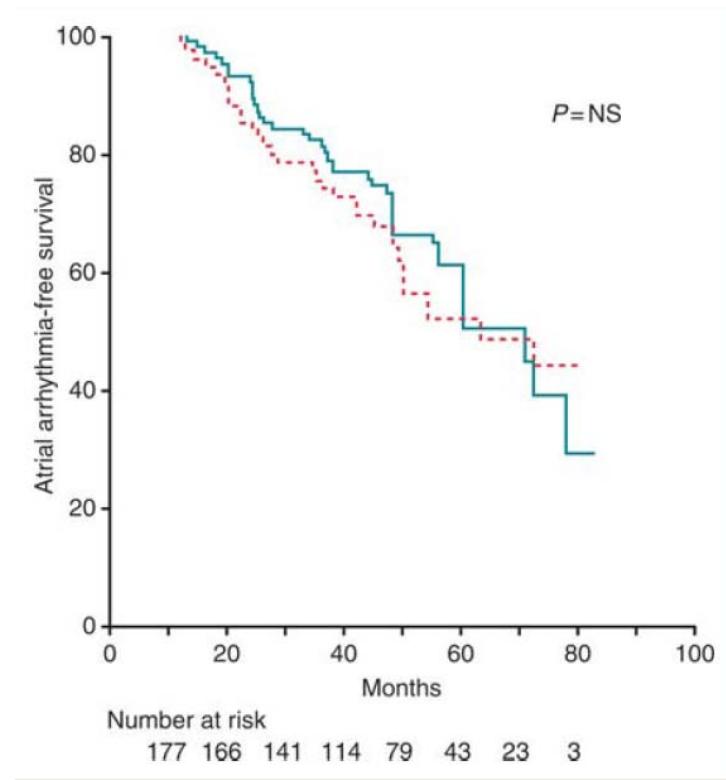

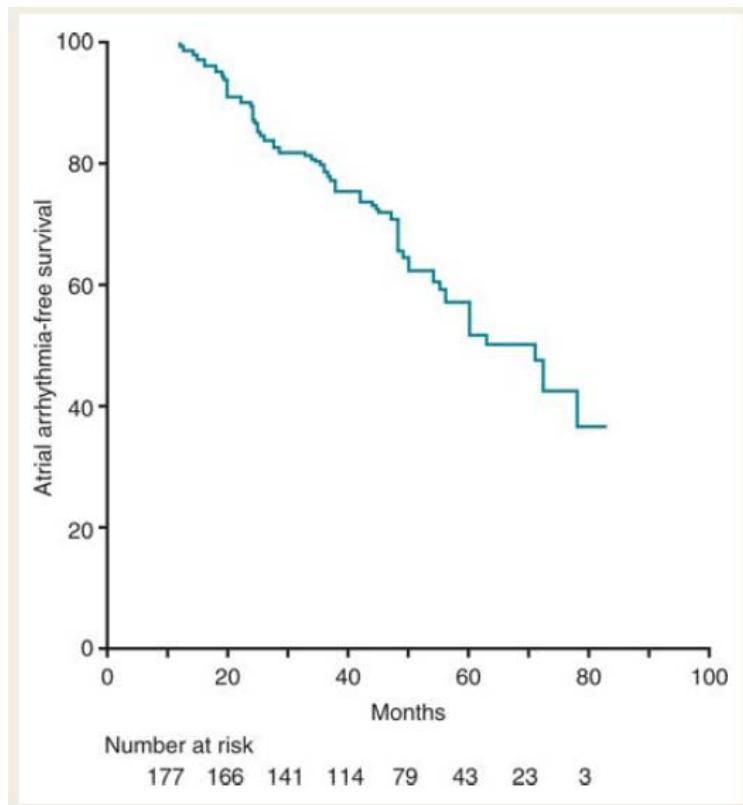

AF symptoms – 10/146 (RFA) vs. 24/148 (AAD), **p=0.012**

Atrial Flutter – no difference

**Conclusion:** AF burden, AF occurrence and AF with symptoms significantly lower in RFA group, but cumulative AF burden not significantly different.

# Ouyang et al (Circ 2010)

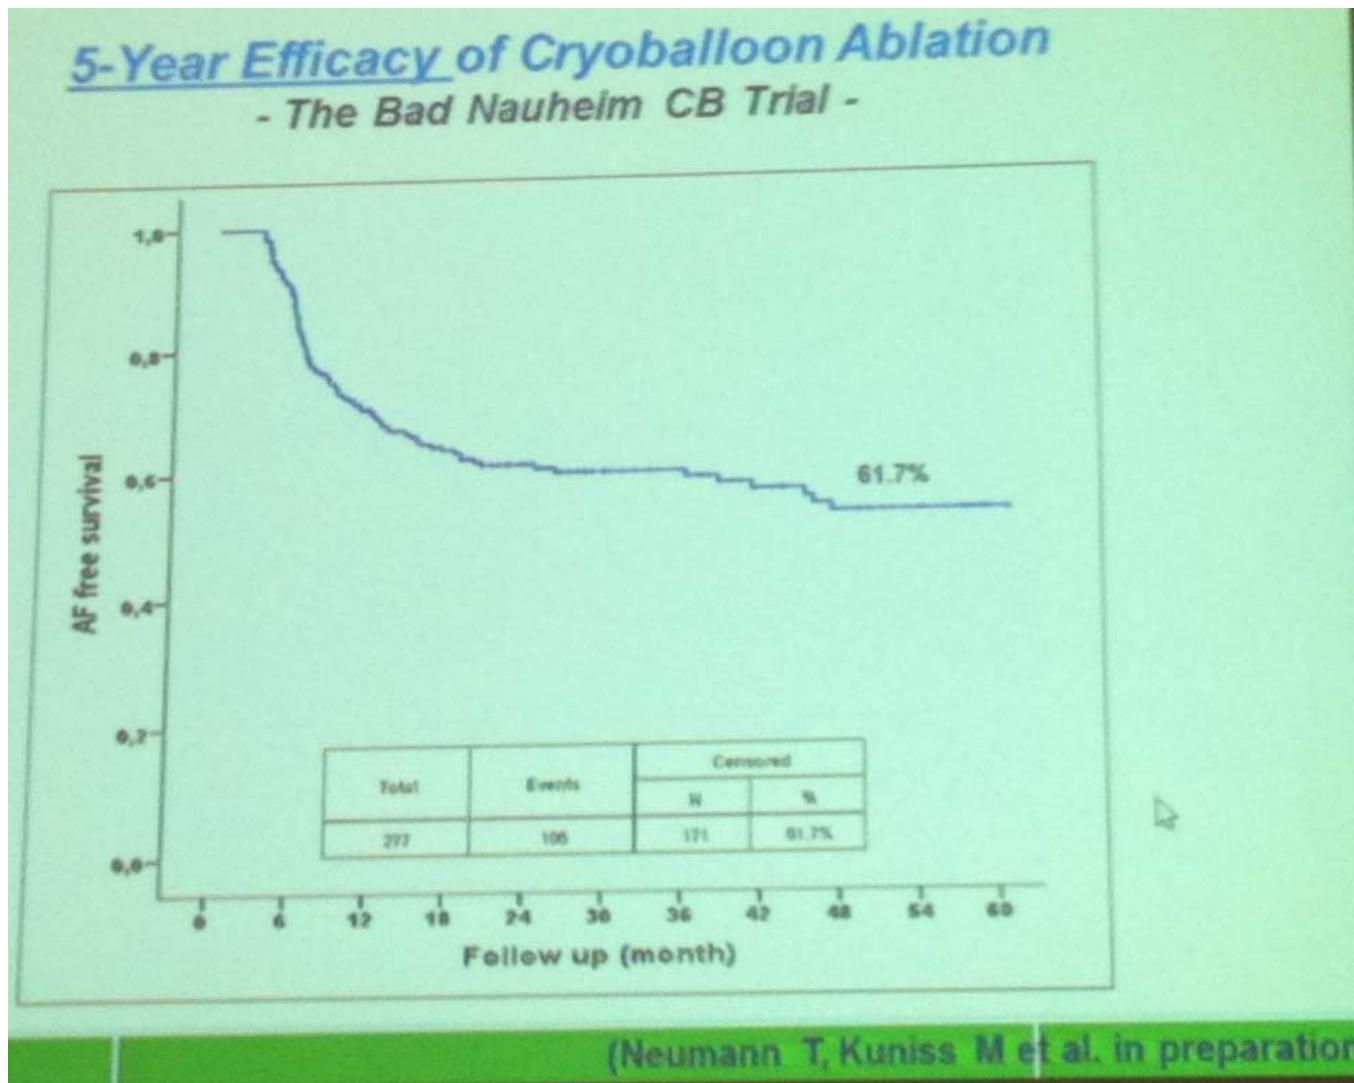

Un procediment

Varios procediments

# I amb criobalo?

# Quins son els resultats amb FA persistent?

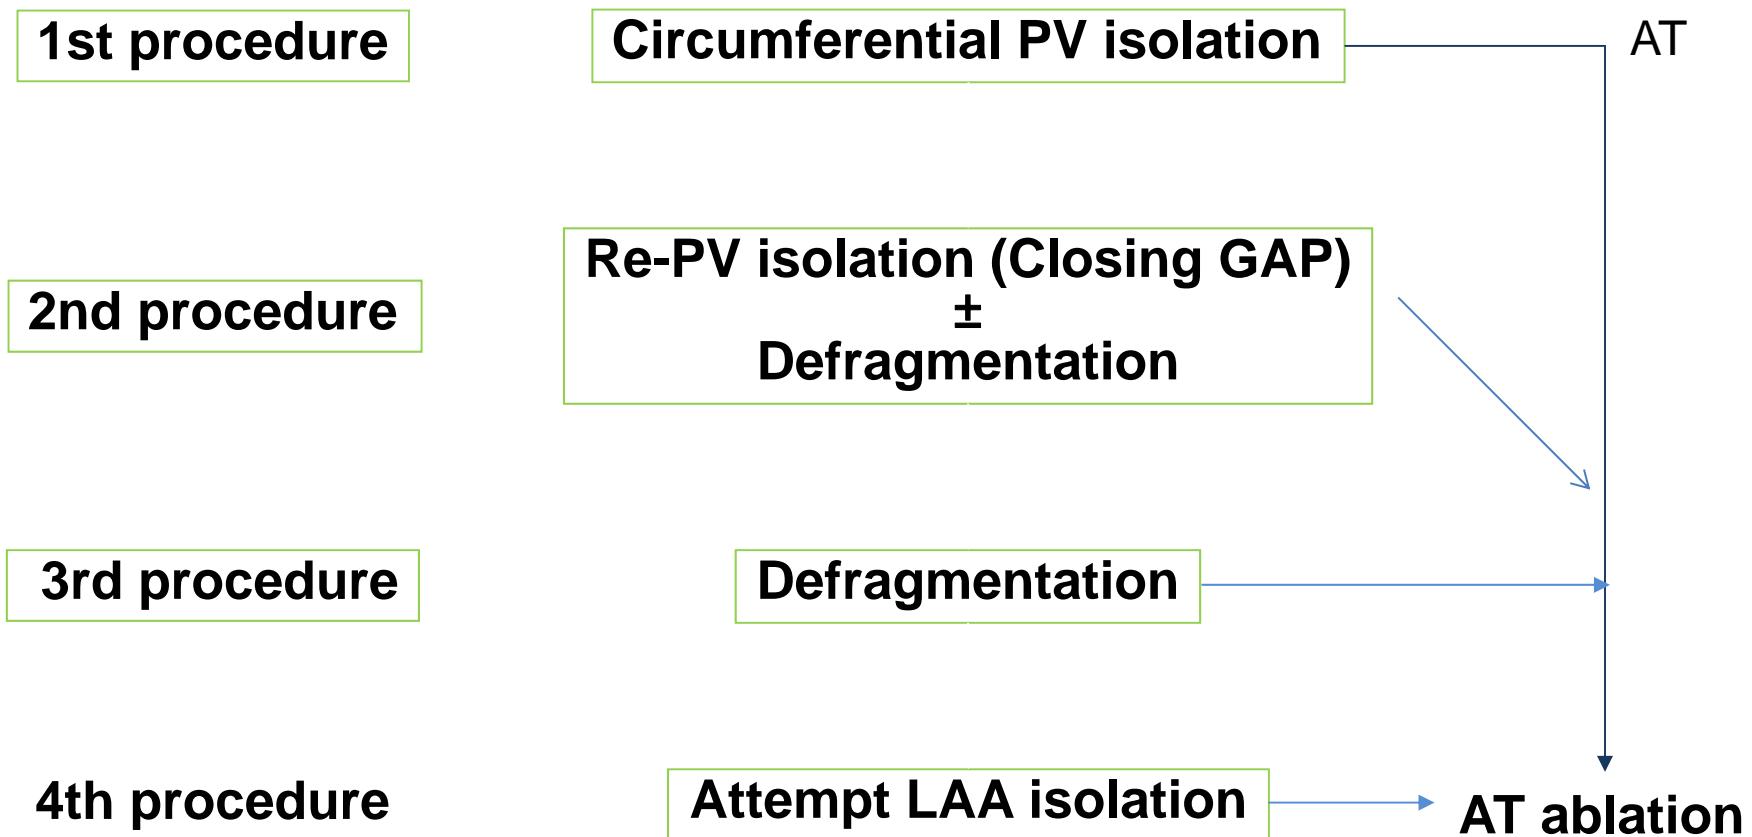

- Nomes hi han dos estudis randomitzats<sup>10-11</sup> que mirin aquest tema incloent entre tots dos 176 pacients. Malgrat la superioritat de la ablació vs. FAA, molts dels pacients amb ablació varen necessitar múltiples procediments i a mes van haver fins un 77% de cross-over en el grup de FAA.

<b>Total</b>	<b>741</b>	<b>4.54</b>

# Quin problema hi ha amb l'ablació?

- S'han fet diferents protocols: Circumferencial contra segmentària. Amb línies associades i sense. Malgrat tot qualsevol comparació amb FAA, aquest sempre són inferiors
- L' ablació és operador dependent, al menys en l'estrategia punt per punt. Pot ser això serà different en el “single shot”
- Els resultats a llarg termini no son òptims: Si però molt millors que amb FAA. A mes la carrega arrítmica disminueix de forma substancial.
- Les complicacions poden no ser banals.
- Ara bé al tanto en deixar progressar la FA de paroxismal a persistent!!!

# Progression From Paroxysmal to Persistent Atrial Fibrillation

## Clinical Correlates and Prognosis

Cees B. de Vos, MD, Ron Pisters, MD, Robby Nieuwlaat, PhD, Martin H. Prins, MD, PhD, Robert G. Tielemans, MD, PhD, Robert-Jan S. Coelen, BSc, Antonius C. van den Heijkant, BSc, Maurits A. Allessie, MD, PhD, Harry J. G. M. Crijns, MD, PhD

	All Patients	No AF Progression	AF Progression	p Value

Ischemic stroke or TIA	31 (3%)	20 (2%)	11 (6%)	0.003
Ischemic stroke	20 (2%)	12 (1%)	8 (5%)	0.005
TIA	11 (1%)	8 (1%)	3 (2%)	0.212
Combined survival/stroke	40 (3%)	27 (3%)	13 (7%)	0.005

# On estem?

- Si en el futur (CABANA) es demostra superioritat en el braç de manteniment en RS amb ablació.....
- Si en el futur (EAST) es demostra que l ablació quan abans millor per tal de que no hi hagi remodelat auricular....
- **Llavors, crec que sera el moment de generalitzar les indicacions al menys en paroxistica.**

Moltes gracies
